

Food chains

- Food chains show what eats what
- The arrows show the movement of energy
- Food chains start with the sun because this is where all energy comes from
- The first step on the food chain is usually a plant or part of a plant because plants can use energy from the sun
- Here is an example food chain:

Sun → Pollen → Beetle → Frog

**Can you make your own food chains
using these living things?**

Newt
Worm
Spider
Otter
Big fish
Small fish
Oak tree
Badger
Beetle
Frog
Grass snake
Cow
Human
Wildflowers
Grass
Bee
