

Smooth Newt

(Lissotriton vulgaris)

- Newts are amphibians like frogs, they start life as eggs in the water
- Little newt larvae (tadpoles) hatch out of the eggs and swim around in a pond
- They then grow legs and turn into baby newts called efts
- Smooth newts and palmate newts look very similar

Froglife is a UK wildlife charity committed to the conservation of amphibians and reptiles - working with people, enhancing lives together for a healthier planet. Find out more about our education projects and activities at www.froglife.org
